## 250 mA SmartOR™ Regulator with V<sub>AUX</sub> Switch

### Product Description

The ON Semiconductor's SmartOR™ CMPWR101 is a low dropout regulator that delivers up to 250 mA of load current at a fixed 3.3 V output. An internal threshold level (typically 4.1 V) is used to prevent the regulator from being operated below dropout voltage. The device continuously monitors the input supply and will automatically disable the regulator when V<sub>CC</sub> falls below the threshold level. When the regulator is disabled, a low impedance, fully integrated switch is enabled which allows the output to be directly powered from an auxiliary 3.3 V supply.

When V<sub>CC</sub> is restored to a level above the select threshold, the low impedance switch is disabled and the regulator is once again enabled.

All the necessary control circuitry needed to provide a smooth and automatic transition between the supplies has been incorporated. This allows V<sub>CC</sub> to be dynamically switched without loss of output voltage.

An output logic signal, DRIVE, is active LOW whenever the internal regulator is disabled.

The CMPWR101 is housed in a 8-pin SOIC package and is available with RoHS compliant lead-free finishing.

### Features

- Automatic Detection of V<sub>CC</sub> Input Supply
- Glitch-Free Output During Supply Transitions
- Built-In Hysteresis During Supply Selection
- 250 mA Output Maximum Load Current
- Fully Integrated V<sub>AUX</sub> Switch
- Overload Current Protection
- Short Circuit Current Protection
- Operates from Either V<sub>CC</sub> or V<sub>AUX</sub>
- 8-Pin SOIC Package
- These Devices are Pb-Free and are RoHS Compliant

### Applications

- PCI Adapter Cards
- Network Interface Cards (NICs)
- Dual Power Systems
- Systems with Standby Capabilities

## TYPICAL APPLICATION CIRCUIT

## SIMPLIFIED ELECTRICAL SCHEMATIC

## PACKAGE / PINOUT DIAGRAM

**Table 1. PIN DESCRIPTIONS**

Pin(s)	Name	Description
1	V <sub>CC</sub>	V <sub>CC</sub> is the power source for the internal regulator and is monitored continuously by an internal controller circuit. Whenever V <sub>CC</sub> exceeds V <sub>CCSEL</sub> (4.25 V typically), the internal regulator will be enabled and deliver a fixed 3.3 V at V <sub>OUT</sub> . When V <sub>CC</sub> falls below V <sub>CCDES</sub> (4.10 V typically), the regulator will be disabled. Internal loading on this pin is typically 0.6 mA when the regulator is enabled, which reduces to 0.1 mA whenever the regulator is disabled. If V <sub>CC</sub> falls below the voltage on the V <sub>AUX</sub> pin, the V <sub>CC</sub> loading will further reduce to only a few microamperes. During a V <sub>CC</sub> power-up or power-down sequence, there will be an effective step increase in V <sub>CC</sub> line current when the regulator is enabled/disabled. This line current transient will cause a voltage disturbance at the V <sub>CC</sub> pin. The magnitude of the disturbance will be directly proportional to the effective power supply source impedance being delivered to the V <sub>CC</sub> input. A built-in hysteresis voltage of 150 mV has been incorporated to minimize any chatter during supply changeover. It is recommended that the power supply connected to the V <sub>CC</sub> input should have a source resistance of less than 0.25 Ω to minimize the event of chatter during the enabling/disabling of the regulator. If the V <sub>CC</sub> pin is within a few inches of the main input filter, a capacitor may not be necessary. Otherwise an input filter capacitor in the range of 1 μF to 10 μF will help to lower the effective source impedance.
2-3	V <sub>AUX</sub>	V <sub>AUX</sub> is the auxiliary power source. When selected, (V <sub>CC</sub> < V <sub>CCDES</sub> ), the auxiliary supply is directly connected to V <sub>OUT</sub> , via the low impedance (0.3 Ω typically) fully integrated switch. The internal loading on this pin is typically less than 10 μA and will increase to 100 μA if V <sub>CC</sub> falls below the voltage on V <sub>AUX</sub> . When V <sub>AUX</sub> = 0 V, the V <sub>CCDES</sub> voltage is inhibited which prevents the regulator from being disabled.
4	GND	GND is the negative reference for all voltages. The current that flows in the ground connection is very low (typically 0.6 mA) and has minimal variation over all load conditions.
5	NC	NC is an unconnected pin which is electrically isolated from the internal circuitry.
6-7	V <sub>OUT</sub>	V <sub>OUT</sub> is the regulator output voltage connection used to power the load. An output capacitor of 4.7 μF is used to provide the necessary phase compensation, thereby preventing oscillation. The capacitor also helps to minimize the peak output disturbance during power supply changeover.
8	DRIVE	DRIVE is a CMOS output logic signal (Active Low) referenced to the V <sub>CC</sub> supply. This output is taken low whenever the internal regulator is not enabled. This output is intended only as a control signal for external circuitry.

## SPECIFICATIONS

**Table 2. ABSOLUTE MAXIMUM RATINGS**

Parameter	Rating	Units
ESD Protection (HBM)	±2000	V
Pin Input Voltages V <sub>CC</sub> V <sub>AUX</sub> DRIVE	[GND – 0.5] to +6.0 [GND – 0.5] to +4.0 [GND – 0.5] to [V <sub>CC</sub> + 0.5]	V
Storage Temperature Range	–40 to +150	°C
Operating Temperature Range Ambient Junction	0 to +70 0 to +125	°C
Power Dissipation (Note 1)	0.5	W

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- The power rating is based on a printed circuit board heat spreading capability equivalent to 2 square inches of copper connected to the GND pins. Typical multi-layer boards using power plane construction will provide this heat spreading ability without the need for additional dedicated copper area. (Please consult with factory for thermal evaluation assistance).

**Table 3. STANDARD OPERATING CONDITIONS**

Parameter	Rating	Units
V <sub>CC</sub>	5.0 ±0.5	V
V <sub>AUX</sub>	3.3 ±0.3	V
Ambient Operating Temperature Range	0 to +70	°C
Load Current	0 to 250	mA
C <sub>EXT</sub>	4.7 ±20%	µF

**Table 4. ELECTRICAL OPERATING CHARACTERISTICS** (Note 2)

Symbol	Parameter	Conditions	Min	Typ	Max	Units
V <sub>OUT</sub>	Regulator Output Voltage	0 mA < I <sub>LOAD</sub> < 250 mA	3.135	3.300	3.465	V
I <sub>LIM</sub>	Regulator Current Limit		275			mA
V <sub>CCSEL</sub>	V <sub>CC</sub> Select Voltage	Regulator Enabled		4.30	4.45	V
V <sub>CCDES</sub>	V <sub>CC</sub> Deselect Voltage	Regulator Disabled	3.90	4.10		V
V <sub>CCHYST</sub>	Hysteresis Voltage	(Note 3)		0.20		V
V <sub>R LOAD</sub>	Load Regulation	V <sub>CC</sub> = 5 V, 5 mA < I <sub>LOAD</sub> < 250 mA		20		mV
V <sub>R LINE</sub>	Line Regulation	I <sub>LOAD</sub> = 5 mA; 4.5 V < V <sub>CC</sub> < to 5.5 V		2		mV
R <sub>SW</sub>	V <sub>AUX</sub> Switch Resistance	V <sub>CCDES</sub> > V <sub>CC</sub> , V <sub>AUX</sub> = 3.3 V		0.25	0.40	Ω
I <sub>RCC</sub> I <sub>RAUX</sub>	V <sub>CC</sub> Reverse Leakage V <sub>AUX</sub> Reverse Leakage	V <sub>AUX</sub> = 3.3 V, V <sub>CC</sub> = 0 V V <sub>AUX</sub> = 0 V, V <sub>CC</sub> = 5 V		2 2	50 50	µA
I <sub>GND</sub>	Ground Current	V <sub>CC</sub> < V <sub>CCDES</sub> , I <sub>LOAD</sub> = 0 mA V <sub>CC</sub> > V <sub>CCSEL</sub> , I <sub>LOAD</sub> = 0 mA V <sub>CC</sub> > V <sub>CCSEL</sub> , I <sub>LOAD</sub> = 250 mA		0.20 0.60 0.70	0.40 1.00 1.20	mA
I <sub>AUX</sub>	V <sub>AUX</sub> Supply Current	V <sub>AUX</sub> > V <sub>CC</sub> V <sub>CC</sub> > V <sub>AUX</sub>		0.20 0.02	0.40 0.10	mA
R <sub>OH</sub>	DRIVE Pull-up Resistance	R <sub>PULLUP</sub> to V <sub>CC</sub> , V <sub>CC</sub> > V <sub>CCSEL</sub>		4.0	8.0	kΩ
R <sub>OL</sub>	DRIVE Pull-down Resistance	R <sub>PULLDOWN</sub> to GND, V <sub>CCDES</sub> > V <sub>CC</sub>		0.1	0.4	kΩ

- Operating Characteristics are over Standard Operating Conditions unless otherwise specified.
- The hysteresis defines the maximum level of acceptable disturbance on V<sub>CC</sub> during switching. It is recommended that the V<sub>CC</sub> source impedance be kept below 0.25 Ω to ensure the switching disturbance remains below the hysteresis during select/deselect transitions. An input capacitor may be required to help minimize the switching transient.

PERFORMANCE INFORMATION (Cont'd)

**CMPWR101 Typical Thermal Characteristics**

The overall junction to ambient thermal resistance ( $\theta_{JA}$ ) for device power dissipation ( $P_D$ ) consists primarily of two paths in series. The first path is the junction to the case ( $\theta_{JC}$ ) which is defined by the package style, and the second path is case to ambient ( $\theta_{CA}$ ) thermal resistance which is dependent on board layout. The final operating junction temperature for any set of conditions can be estimated by the following thermal equation:

$$\begin{aligned} T_{JUNC} &= T_{AMB} + P_D(\theta_{JC}) + P_D(\theta_{CA}) \\ &= T_{AMB} + P_D(\theta_{JA}) \end{aligned}$$

The CMPWR101 uses a standard SOIC package. When this package is mounted on a double-sided printed circuit board with two square inches of copper allocated for “heat spreading”, the resulting  $\theta_{JA}$  is 85°C/W.

Based on a maximum power dissipation of 0.43 W (1.7 V x 250 mA) with an ambient of 70°C, the resulting junction temperature will be:

$$\begin{aligned} T_{JUNC} &= T_{AMB} + P_D(\theta_{JA}) \\ &= 70^\circ C + 0.4 W (80^\circ C/D) \\ &= 70^\circ C + 37^\circ C = 103^\circ C \end{aligned}$$

Thermal characteristics were measured using a double-sided board with two square inches of copper area connected to the GND pin for “heat spreading”.

Measurements showing performance up to junction temperature of 125°C were performed under light load conditions (5 mA). This allows the ambient temperature to be representative of the internal junction temperature.

**NOTE:** Note: The use of multi-layer board construction with separate ground and power planes will further enhance the overall thermal performance. In the event of no copper area being dedicated for heat spreading, a multi-layer board construction, using only the minimum size pad layout, will provide the CMPWR101 with an overall  $\theta_{JA}$  of 100°C/W which allows up to 500 mW to be safely dissipated.
